

# Brucella

<i>Brucella spp.</i>	
<i>Brucellaceae</i>	
<i>Brucella</i>	
Brucella melitensis on blood agar	
<b>Morphology</b>	For cocobacilli
<b>Relation to oxygen</b>	strictly aerobic
<b>Cultivation</b>	prolonged blood agar
<b>Antigens</b>	surface L antigen
<b>Source</b>	domestic and wild animals
<b>Transmission</b>	contact with a sick animal, contaminated aerosol and milk
<b>Incubation time</b>	2-4 weeks
<b>Disease</b>	brucellosis
<b>Diagnostics</b>	blood culture, cultivation, serology
<b>Therapy</b>	doxycycline in combination with rifampicin
<b>MeSH ID</b>	D002002

*Brucella* bacteria are small, gram-negative, strictly aerobic immobile short rods or cocobacilli. They do not form spores. These are typical animal parasites. *B. abortus*, *B. melitensis*, *B. suis* and *B. canis* are pathogenic to humans .

## Cultivation and biochemistry

Brucella require an extended cultivation time . Colonies have a glossy moist appearance, can be translucent to cloudy and often show fluorescence. They are catalase positive and oxidase positive. Bacteria produce endotoxin , which in its effects resembles enterobacterial endotoxin .

## Disease

See the Brucellosis page for more information .

Brucellosis is a typical anthropozoonosis , the infection is typical in both domestic and wild animals. The site of infection in humans is most often injured skin or conjunctiva, and infection can occur by inhaling a contaminated aerosol or consuming improperly treated milk from sick animals. **Thanks to a careful veterinary inspection, brucellosis has been eradicated in the Czech Republic; today, only imported diseases occur in our country .**

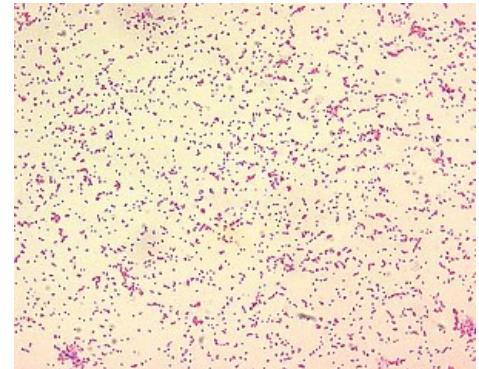

Brucellas are among the **intracellular parasites of phagocytic cells** , in macrophages they are distributed throughout the body. Granulomas subsequently form in the affected organs. The course of the disease varies from species to brucella.

## Diagnostics

Diagnosis is more complicated due to non-specific clinical manifestations, it is most often performed using blood culture and serologically. In antibody-based assays, brucellosis show cross-reactivity with *Francisella tularensis* . The most reliable method of diagnosis is cultivation, which is often not successful due to its complexity.

## Therapy

The combination of doxycycline with rifampicin is given for six weeks. In children, doxycklin is replaced by co-trimoxazole.
