

Corticosteroid-dependent asthma

Corticosteroid-dependent asthma is asthma in patients with severe asthma (DTTA) requiring systemic oral corticosteroids.

About 5% of asthma patients fall into the category of *difficult-to-treat asthma* (DTTA). They cannot achieve or keep asthma under control.

Deterioration due to irritation at reflux disease, as well as **reduced compliance and adherence** to treatment in severe **psychiatric** illness, can lead to DTTA.
